

```
private MoviePresenter mPresenter = new MoviePresenter();
public DataBindingAdapter() {
    super(R.layout.item_movie);
* 当 ViewHolder 创建完毕以后,会执行此回掉
* 可以在这里做任何你想做的事情
* /
@Override
protected void onItemViewHolderCreated(@NotNull BaseViewHolder viewHolder, int viewType) {
   // 绑定 view
   DataBindingUtil.bind(viewHolder.itemView);
@Override
protected void convert(@NotNull BaseViewHolder helper, @NotNull Movie item) {
   if (item == null) {
       return;
   // 获取 Binding
   ItemMovieBinding binding = helper.getBinding();
   if (binding != null) {
       // 设置数据
       binding.setMovie(item);
       binding.setPresenter(mPresenter);
       binding.executePendingBindings();
```

## 基于 BaseProviderMultiAdapter 的用法

由于使用了 Provider ,所以相关事务并不在 Adapter 里处理。需要在 Provider 中对数据进行绑定。

Adapter 代码如下(无需特殊处理,和普通的 BaseProviderMultiAdapter 写法一样):

```
public class ProviderMultiAdapter extends BaseProviderMultiAdapter<ProviderMultiEntity> {
    public ProviderMultiAdapter() {
        super();
        addItemProvider(new ImgItemProvider());
        addItemProvider(new TextImgItemProvider());
        addItemProvider(new TextItemProvider());
    * 自行根据数据、位置等内容,返回 item 类型
    * /
    @Override
    protected int getItemType(@NotNull List<? extends ProviderMultiEntity> data, int position) {
        switch (position % 3) {
           case 0:
               return ProviderMultiEntity.IMG;
           case 1:
               return ProviderMultiEntity.TEXT;
           case 2:
               return ProviderMultiEntity.IMG_TEXT;
           default:
               break;
        return 0;
```

## Provider 代码如下:

```
public class ImgItemProvider extends BaseItemProvider<ProviderMultiEntity> {
   @Override
   public int getItemViewType() {
       return ProviderMultiEntity.IMG;
   }
   @Override
   public int getLayoutId() {
       return R.layout.item_image_view;
   }
    /**
    * 当 ViewHolder 创建完毕以后,会执行此回掉
    * 可以在这里做任何你想做的事情
    * /
    @Override
   public void onViewHolderCreated(@NotNull BaseViewHolder viewHolder) {
       // 绑定View
       DataBindingUtil.bind(viewHolder.itemView);
   }
   @Override
   public void convert(@NotNull BaseViewHolder helper, @NotNull ProviderMultiEntity data) {
       Movie movie = data.getMovie();
       // 获取 Binding
       ItemMovieBinding binding = helper.getBinding();
       if (binding != null) {
           binding.setMovie(movie);
           binding.executePendingBindings();
```

}
